

MySQL

Exercise 2

1. Select from any table a number and determine whether it is within a given range (for example, between 1 and 10).

Output-

```
mysql> delimiter //
mysql> create procedure exptwoone()
-> begin
-> declare x int;
-> select sal into x from emp where ename ='KING';
->
-> if(x between 1 and 10 ) then
-> insert into temp values(x,'Within Range');
-> else
-> insert into temp values(x,' not Within Range');
-> end if ;
-> end //
Query OK, 0 rows affected (0.17 sec)

mysql> delimiter ;
mysql> call exptwoone();
Query OK, 1 row affected (0.14 sec)

mysql> select*from temp;
```

```
| 3000 | not Within Range |
+-----+-----+
53 rows in set (0.00 sec)
```

2. Select from any table three positive integers representing the sides of a triangle, and determine whether they form a valid triangle. Hint: In a triangle, the sum of any two sides must always be greater than the third side.

Output-

```
mysql> delimiter //
mysql> create procedure exptwotwo()
-> begin
-> declare x int ;
-> declare y int ;
-> declare z int ;
->
-> select firstSide,secondSide,third into x, y,z from triangle where name ='rosh';
-> if(x + y > z and x + z > y and y + z > x) then
-> insert into temp values(x,'valid triangle');
-> else
-> insert into temp values(x,' not valid triangle');
-> end if ;
-> end //
Query OK, 0 rows affected (0.01 sec)

mysql> delimiter ;
mysql>
mysql> call exptwotwo();
Query OK, 1 row affected (0.14 sec)
```

```
| 12 | valid triangle |
+-----+
54 rows in set (0.00 sec)

mysql>
```

3. Check if a given year is a leap year. The condition is:- year should be (divisible by 4 and not divisible by 100) or (divisible by 4 and divisible by 400.). The year should be Selected from some table.

Output-

```
mysql> delimiter //
mysql> ^C
mysql> delimiter //
mysql> create procedure exptwothreeer()
-> begin
-> declare x int;
-> select sal into x from emp where ename='KING';
-> if(x%4=0 and x%100!=0) then
-> insert into temp values(x,'leap year');
-> elseif(x%400=0)then
-> insert into temp values(x,'leap year');
->
-> else
-> insert into temp values(x,'leap year');
-> end if;
-> end //
Query OK, 0 rows affected (0.28 sec)
```

4. Write a program that Selects from any table two character strings. Your program should then determine if one character string exists inside another character string.

Output-

```

mysql> delimiter //
mysql>
mysql> create procedure exptwofour()
    -> begin
    -> declare s1 varchar(50);
    -> declare s2 varchar(50);
    -> select firstString,secondString into s1,s2 from Strings where id = 1;
    -> IF LOCATE(s2, s1) > 0 THEN
    ->     SELECT 'Substring exists' AS Result;
    ->     ELSE
    ->     SELECT 'Substring does not exist' AS Result;
    ->     END IF;
    ->
    -> END //
ERROR 1304 (42000): PROCEDURE exptwofour already exists
mysql>
mysql> DELIMITER ;
mysql>
mysql> call exptwofour();
+-----+
| Result                |
+-----+
| Substring exists      |
+-----+
1 row in set (0.01 sec)

Query OK, 0 rows affected (0.01 sec)

```
